

Chip Cards.

What is a chip card?

Chip cards (also known as “EMV” cards) have an embedded chip to hold data that is needed to process payment transactions. Simply put, chip cards make your life easier. When you make purchases in stores, the smart chip adds a layer of security to the transaction as it creates a unique transaction code that cannot be used again. This helps to significantly reduce counterfeit card fraud.

How does it work?

Note: The experience may differ slightly depending on terminal used.

1. Insert your chip card into the reader.
2. Approve the amount.
3. Enter your PIN or signature as required.
4. Remove your chip card when prompted.
